Initial fertilizing with microgranulates

... the special fertiliser for sowing

The basic idea:

Meeting the nutrient requirements for optimum seedling development

Advantages of initial dressing

- Immediately available nutrients
- More rapid nutrient uptake during germination
- Optimized root development
- Optimized seedling development

Field trials with maize:

without initial dressing

with initial dressing

Other application areas:

sugar beet, rape, cereals, pasture

The challenge:

- Distribution with fertiliser in the same operation as sowing
- Deposition of granulate directly next to seeds
- Precise dosaging of granulate quantities

The APV solution:

Mounting a pneumatic PS 120 D - 500 D seed drill on the sowing machine

The APV solution:

Mounting a pneumatic PS 120 D - 500 D seed drill on the sowing machine

The APV solution:

Mounting a pneumatic PS 120 - 500 seed drill on the sowing machine

The APV solution:

Mounting a pneumatic PS 120 D - 500 D seed drill on the sowing machine

The APV solution:

Mounting a pneumatic PS 120 - 500 seed drill on the sowing machine

The pneumatic APV seeding devices

extremely versatile

- Cultivation of main crops (e.g.: rape)
- Cultivation of "biogas" crops (e.g.: green cut rye)
- Reseeding grass and pasture reconditioning
- Intercrop cultivation
- Undersown crops
- Slug pellets
- Root dressing
- Initial dressing with microgranulate
