

Maize Nutrition

Top up your

Why?

- Maize crops remove 14kg N per tonne dry matter- a 9t/ha crop needs 130kg N
- Broadcast application of N encourages development of roots in the topsoil at the expense of subsoil penetration
- Application of N through manures can be difficult to measure
- Large amounts of nitrogen can result in soft vegetative growth rather than cobs

Our Solution...

Efficient N 28-0-0 w/w

- Efficient N supplies a steady release of nitrogen to the plant over a period of 12-14 weeks
- The formulation of Efficient N with urea and methylene urea helps develop good root structure rather than the soft leafy growth associated with nitrate N
- Liquid formulation, easy to apply, compatible with most pesticides
- Reduced scorch & leaching with lower environmental impact

Apply 20-40l/ha through the season
