

Technical Bulletin

Tokio for Oilseed Rape

9-54-6 + Micros

Current Challenges

- Current conditions make drilling and establishment of Oilseed Rape difficult
- Top soil may now be wet but underneath is still very dry so nutrient availability may be limited
- These factors make it essential that the young plant has rapid access to nutrients which will help the roots develop and improve establishment

Solution - Sipcam Tokio

- Sipcam Tokio can be sprayed as soon as plants develop leaves, although designed for foliar application roots can also absorb any nutrients which reach the soil.
- The high rate of P helps good root growth and establishment when soil uptake may be limited
- Micro-nutrients are chelated to improve uptake.

Ideal Applications

- Oil seed rape – 2.5-3kg/ha
