## **Quality herbicide avoids the buffers**

Clomazone-based herbicide Mohawk CS from Sipcam can be used on a wider range of crops than before and no longer has a 10m non-target plant buffer zone.

After submitting additional data to CRD, Mohawk CS has had peas, beans and carrots added to the label which already included winter and spring oilseed rape and potatoes.

In addition to removal of the buffer zone the hazard phase has been removed from the label. The active ingredient is 360 G/L Clomazone.

James Ward of Sipcam said:

“Mohawk CS is a high quality capsule suspension formulation making it easy and effective to use alone or in an appropriate tank mix. Now that it can be used on more crops and with fewer restrictions it increases the options for efficient herbicide control across the farm.”
